Code Challenge

Using ES5, have a func defined as QuestionMarks(str) take the string parameter, which will contain single digit numbers, letters, and question marks, and check if there are exactly 3 question marks between every pair of two numbers that add up to 10. If so, then your program should return the string true , otherwise it should return the string false . If there aren't any two numbers that add up to 10 in the string, then your program should return false as well.

Example - if str is "arrb6???4xxbl5???eee5" then your program should return true because there are exactly 3 question marks between 6 and 4, and 3 question marks between 5 and 5 at the end of the string.

Sample Test Cases
Input:"bb6?9"
Output:"false"

Input:"bcc?7??ccc?3tt1??????5"
Output:"true"
